Five creators to test next

Prepared for the Little Joys Marketing Manager | Keshav Mallawat | 5 November 2026

Question	Which five of 20 creators to test, and what each should say	**Period covered**	Ads launched 2026-06-10 to 2026-10-09, results to 2026-10-26; posts to 2026-10-27
Status	Final version. Not legal advice.	**Ad figures**	Simulated numbers supplied by Galvor, not Little Joys results

Every figure here is a row in outputs/final/claims.csv in the code repository, with its sample size and caveat. The tagged copy, report.md, shows the claim ID beside each number. Grey IDs such as LJ-007 name the source text; the register on the last page explains them.

5 + 3
creators to test first, plus three backups in order

2.22 vs 0.92
return per rupee when a child reacts to the taste vs not, on 80 simulated ads

3 of 5
picks rank outside the score's top five (6th, 9th, 10th); I chose them for food content and role

1. The answer

Five creators to test now, three backups, and one condition: clear legal and exclusivity before anyone films.

Recommendation
Test CR-13, CR-03, CR-11, CR-01 and CR-19 first, in a small controlled round. If one cannot go ahead, use CR-05, CR-09 and CR-16 in that order.
Why these five: together they cover the roles a test needs. CR-13 already makes branded family content. CR-03 and CR-01 are doctors who can speak on nutrition with authority. CR-11 is a family vlogger with a child in every recent post. CR-19 already works in milk. I chose them for fit with feeding content and for a spread of roles, not for the score alone.
This is my judgement, not the score's top five: the score alone would pick CR-12, CR-15, CR-13, CR-09 and CR-19. Later checks led me to set CR-12 and CR-15 aside and to move CR-09 to backup (section 3).

Read this before you rely on it
The ad figures are simulated. They are not Little Joys results or forecasts.
The labels come from an AI system and are not always right.
The ad findings are associations. They do not prove that an ad style or a creator causes sales.

Creator	Role	What they bring	Main risk
CR-13 mumma_and_ridhu	Ad integrator	Already makes branded family content: 60.0% of her 20 recent posts are sponsored. Top five in 83.5% of 200 resamples; rank moves only from 3 to 2 without comment-for-link posts.	Only 5.0% of recent posts mention food; feeding content is new for her. No audience data.
CR-03 ekamichildcare	Clinical voice	Most food content of the five: 35.0% of recent posts. No comment-for-link posts. Only 10.0% sponsored.	Flagged for legal review. Sponsored a rival, Troovy, on 2026-09-07. Weak stability: top five in 15.0% of resamples.
CR-11 raja_choudhary04	Family vlog	A child appears in all 20 recent posts and 25.0% mention food. No comment-for-link posts.	Sponsored rivals three times: Gritzo twice, Troovy on 2026-10-07. Lowest stability: 11.5%. A child on camera is not a child tasting.
CR-01 drgarima_mehta	Clinical voice	30.0% of recent posts mention food. Her rank improves from 6 to 4 without comment-for-link posts. Lightly sponsored at 10.0%.	Flagged for legal review. Too few sponsored posts to judge her sponsored work. Top five in 28.5% of resamples.
CR-19 instamommy_suchi	Milk-category creator	Has already posted milk-nutrition content, including for a rival [P-CR-19]. Top five in 50.5% of resamples; 15.0% of posts mention food.	75.0% of recent posts are sponsored, the most of the five. Sponsored Bournvita on 2026-08-02 and Complan on 2026-10-06.

Backups, in order: use the next one if a creator declines or fails the checks in section 5.

Backup	Why	Main risk
CR-05 sia_3vedi	Largest reach of the 20: 2,831,180 followers. A child appears in all 18 recent posts.	Only 5.6% of recent posts mention food. Top five in 19.5% of resamples.
CR-09 doc_mama_and_babies	Ranks 4 of 20 on the score and is in the top five in 61.0% of resamples.	Three flags: hidden likes, no audience data, legal review. 72.7% of her 11 recent posts are sponsored; she did a sponsored Little Joys post on 2025-07-11.
CR-16 paediatrics_decoded	A paediatrician with no sponsored posts in the window; top five in 34.0% of resamples.	Flagged for legal review. A third clinical creator breaks the cap of two; she comes in only if CR-01 or CR-03 drops.

2. What each creator should say

One idea, one hook and one quoted product line per creator. No line claims a health outcome.

Creator	Content idea	Suggested hook	Product line (from Little Joys' ads)
CR-13	A home-routine film in her own style: a relatable evening-hunger problem, one product as the quiet fix, a soft close with no comment-for-link. Add a child-tastes beat only if her child really reacts [P-CR-13]. **Avoid:** high-pressure sales language, cold studio lighting, and anything that ignores festivals and family context.	"The 4 PM hunger gap: here's what I keep ready."	"Made with ragi, bajra, almonds and walnuts, sweetened naturally with jaggery and dates." [LJ-007]
CR-03	A calm doctor explainer on the nutrition gap, with on-screen text. The product is one option in a balanced diet, never a cure. Close: "check the label, ask your paediatrician" [P-CR-03]. **Avoid:** influencer-style transitions, casual slang, and a script that reads like an advert.	"Bachcha khaana kha raha hai, par kya use sahi nutrition mil raha hai?" (He is eating, but is he getting the right nutrition?)	"No added sugar, no preservatives." Mixes into meals like roti and pancakes [LJ-036]
CR-11	A candid mini-vlog of the child's morning-milk moment: the mix goes in, the child tastes it and reacts on camera. Film that beat only if the reaction is real [P-CR-11]. **Avoid:** studio lighting, formal scripted claims, and frames with no family in them.	"Mamma ke morning milk wale natak ka ek solution." (A fix for the morning-milk drama.)	"Made with millets and dry fruits, sweetened with jaggery and dates." [LJ-009]
CR-01	A split-screen doctor explainer in Hindi with English product terms: read the ingredient label, then show what is in the pack. Ingredients and general benefit only [P-CR-01]. **Avoid:** English-only audio and a sales pitch with no medical context.	"What I check on a food label before it becomes my child's daily habit."	"Sweetened with jaggery and dates, with zero refined sugar or artificial sweeteners." [LJ-072]
CR-19	A household-prop explainer in her style (she often uses props such as magnifying glasses [P-CR-19]): plain milk next to milk with the mix, then the child tastes and reacts. Do not reuse the magnifying-glass-over-milk visual from her Complan post. **Avoid:** a cold, corporate advert feel; show the product used at home.	"Bachche ke milk mein main kya add karti hoon, aur kyun?" (What I add to my child's milk, and why.)	"No artificial sweeteners, naturally sweetened with jaggery and dates." [LJ-022]

Before any of this goes live
Hooks are suggestions to adapt in each creator's voice. None names the brand yet: the first-3-seconds test in section 5 adds that in one cut.
The Hindi lines need a native-speaker check.
Product lines are quoted from Little Joys' own ad text and **need legal sign-off.** Leave protein figures out until legal confirms them: the Nutrimix ads quote 5g, 6g and 9g, and the mix in LJ-036 quotes 12g per scoop.
No line should mention disease, treatment or a health outcome.

3. How the shortlist was chosen

The score picked a different five. I overruled it where the data was weakest, and I show what that costs.

The scoring rule was fixed and committed before any creator was scored. Each creator got three parts, and each part was ranked against the other 19 creators.

Part of the score	Weight	What it measures
Evidence fit	0.40	How often recent posts show a child with the product.
Audience response	0.35	Comments and reshares per play.
Sponsored fit	0.25	How sponsored posts do next to ordinary ones.

"Recent" means the 12 months to 2026-10-27, which is 374 of the 392 posts. A part with too little data scores a neutral 0.5: it needs at least 10 posts with plays, or at least 4 sponsored posts. A portfolio rule, also set in advance, allows at most 2 clinical-persona creators in the final five.

Checks added after I saw the ranking are post-hoc and not part of the score:

- Rank stability: I resampled each creator's recent posts 200 times, re-scored everyone each time, and counted how often a creator stays in the top five. A creator who stays in most runs is a steady pick; one who rarely does depends on which posts happen to fall in the window.
- Food content: the share of recent posts mentioning food or feeding terms.
- Comment-for-link posts: the share of posts asking viewers to "comment for a link", which can inflate comment counts and so overstate audience response.
- A hand check of 24 posts tagged "child and product": only 3 showed a child eating or reacting to food, so the score's feeding measure is weak.

Where my judgement changed the score-only result:

- **CR-12 (score rank 1) and CR-15 (rank 2) are out.** Comment-for-link posts are 40.0% of CR-12's recent posts and 45.0% of CR-15's. Without them CR-15 falls from rank 2 to 14, but CR-12 stays at rank 1. CR-12 is out for a different reason: none of its recent posts mention food.
- **CR-09 moves to backup.** Ranked 4 on the score, but with three flags, a 72.7% sponsored share on only 11 recent posts and an earlier sponsored Little Joys post.
- **CR-20 is not on the list.** The audience record for CR-20 shows 70.1% men and lists Little Joys among the brands it worked with in the past year. It ranks 16 on the score and none of its recent posts mention food. One thing does not line up: no recent post shows Little Joys, so check whether that partnership is still running before ruling CR-20 out for good.
- CR-01 (ranked 6), CR-03 (9) and CR-11 (10) come in **for food content and a spread of roles, not for score.** With the cap of two clinical creators, CR-03 beats CR-16 (15.0% food, no sponsored posts) and CR-05 has almost no food content, so CR-11 takes the last place.
- The cost: CR-03 and CR-11 are less stable than CR-16, CR-05 and CR-09. I also re-scored with three alternate weightings (sponsored fit dropped, set to neutral for everyone, or needing at least 4 non-sponsored posts). Counting the original score as one of four versions, CR-13 and CR-19 are in the top five in all 4, CR-01 in 2, CR-11 in 1 and CR-03 in none. So **CR-03 is on the list for his food content and clinical role, not for score.**

Creator	Score rank (of 20)	Rank stability (share of 200 resamples in the top five)	Food content (recent posts)	Sponsored share (recent posts)
CR-13 mumma_and_ridhu	3	83.5%	5.0%	60.0%
CR-19 instamommy_suchi	5	50.5%	15.0%	75.0%
CR-01 drgarima_mehta	6	28.5%	30.0%	10.0%
CR-03 ekamichildcare	9	15.0%	35.0%	10.0%
CR-11 raja_choudhary04	10	11.5%	25.0%	35.0%
Set aside: CR-12	1	99.0%	0.0%	15.0%
Set aside: CR-15	2	76.0%	10.0%	30.0%

Stability colour: green is 50% or more of resamples, amber 20% to 49%, red under 20%.

4. What the ads show

One ad pattern holds up: a child reacting to the taste, most strongly when a child leads. One is only a lead: the brand named early. Neither can be tied to a creator.

How to read the table:

- Return per rupee (ROAS) is revenue divided by ad spend. A value of 2.22 means the ads in that group brought in about Rs 2.22 for every Rs 1 spent. A value under 1, such as 0.92, means they brought back less than they cost.
- Each group is pooled (total revenue over total spend), so a high-spend ad counts for more than a small one. Purchase rate is purchases divided by link clicks.
- The 95% interval is the range of gaps that resampling the ads would give. If it includes zero, the gap could be chance.
- All figures use the 80 ads with at least 10,000 rupees of spend, and every label used is present for all 80.

Finding	With it: return per rupee	Without it	Gap and 95% interval	Purchase rate per link click, with vs without
1. A child reacts to the taste Tier: **supported**	2.22 on 36 ads	0.92 on 44 ads	+1.31, from 0.22 to 2.35. Excludes zero	4.07% vs 2.28%
2. The brand is named in the first 3 seconds Tier: **suggestive**	2.21 on 30 ads	1.11 on 50 ads	+1.10, from -0.21 to 2.44. Includes zero	4.62% vs 2.40%

Both gaps keep their direction under every check I fixed before looking at results: three different spend floors, medians instead of totals, dropping the highest-spend ad from each group, and leaving out each of the 8 stop-date batches in turn. Three limits stay. Finding 1 reverses inside gummies (5 ads with a reacting child, 14 without), too few to count as a check, and 43 of the 80 ads are milk-mix powder, so it is mostly a milk-mix result. Finding 1's interval starts only 0.22 above zero, and finding 2's includes zero, so **treat finding 2 as a lead.** The ads sit in only 8 stop-date batches, so the true intervals are wider than shown.

A third result, that ads presented by a parent or caregiver return less (0.92 against 2.14 on 47 and 33 ads), overlaps with finding 1: 22 ads sit in both groups. I did not count it as a separate finding. Splitting the two shows what sits underneath finding 1:

Child reacts to the taste	Parent or caregiver presents	Return per rupee	Ads
Yes	**No**	**3.03**	14
Yes	Yes	1.21	22
No	Yes	0.75	25
No	No	1.16	19

The lift sits in one corner. When a child reacts and someone other than a parent presents, return is 3.03. When a parent presents and the child reacts, it is 1.21, close to the 1.16 of ads with neither feature. Nine of those 14 ads

have a child presenting. This split is post-hoc and descriptive: there is no interval, the cells are small, and most of the ads are milk-mix powder. My reading is that the lift goes with a child-led format, not with the reaction shot alone.

What this means for the shortlist. Four of my five creators are adult presenters (two doctors, two mothers); only CR-11 films a child as the lead. The ads carry no creator ID, so they cannot say how any creator would do. I kept the five, and I added a child-led cut for every creator to the test in section 5. Finding 1 was one of five hypotheses set before I saw the results; finding 2 was one of four exploratory ones (9 in all). The 179 comparisons counts every rerun and check, but with that many looks some gaps will be luck. Use these findings as things to test, not rules.

5. Limits and next steps

The data cannot show price, audience fit or cause. These steps close the gaps, and these facts would change my answer.

What could be wrong:

- The performance numbers are simulated and I treated them as the brand's own ad export. They are not a forecast. The AI labels matched the answers on my review sheet in 114 of 120 judgements on 20 ads. An AI assistant pre-filled that sheet and I reviewed it, so it is a weaker check than a sheet filled in blind. I did not watch any video; creator descriptions come from captions, profile text and labels.
- Audience data exists for only 3 of 20 creators, none of the five. There is no pricing data, so nothing here says what a creator costs. Reach is context, not scored: the five have 814,499 followers together, less than CR-05 alone.
- The hand check covered 24 posts, none from CR-03, so I do not know how often he shows a child eating. Rank stability is weak for CR-03, CR-11 and CR-01. 39 of 392 posts have no play count; days_live is one day short in 74 of 100 ads and is not used.
- Data check against the source files: 100 ads, 20 creators, 392 posts, 3 audience records; money in rupees; the 80 ads over the spend floor hold 98.5% of spend and return 1.50 per rupee together. A separate script in the repo, src/verify_independent.py, recomputes the headline figures from the raw files with its own code, and all 26 checks match.

What would change my answer:

- A creator says a competing deal is open, or will not give category exclusivity: move to the next backup in order.
- Legal rejects a clinical creator's claims or disclosure: drop that creator, and do not fill the slot with CR-16 if it would make three clinical creators.
- Audience data, once bought, shows a creator's followers are mostly outside the buyer you want: drop that creator.
- Creator rates make a pick cost far more than the others: re-rank on cost per test, which this data cannot do.

Next steps, in order:

1. **Product and legal review.** Legal confirms every product line and the protein figure. Clinical creators CR-03 and CR-01 are flagged for review; ASCI's influencer guidelines expect a disclosure label on paid posts and, for health and nutrition advice, qualifications stated upfront [EXT-ASCI]. Legal should also read the 2022 central guidelines on misleading advertisements and endorsements [EXT-DCA], and confirm who signs for CR-11, whose bio lists a manager.
2. **Exclusivity checks.** CR-03, CR-11 and CR-19 have each posted for a rival recently. Ask each of the five whether a competing deal is open, and ask for category exclusivity with a cool-off period. Check the history of CR-09's Little Joys post before any approach. The rival brands named here (Gritzo, Troovy, Complan, Bournvita) are my reading of the category; the data does not mark rivals.
3. **A small controlled test.** Fix the creator and the product, change one thing per cut ("Little Joys" said in the first 3 seconds or later; child-tastes beat on or off; a child-led version or an adult-led one), spend the same on each cut, and judge by purchase rate per link click. Write the pass mark down before launch. One test will not settle a creator.
4. **Fill the gaps:** audience panels for the five, creator rates, and a creator ID on each ad.

Source register

Every claim ID is also a row in outputs/final/claims.csv, with its n and caveat. Code and rebuild steps: github.com/keshavmallawat/little-joys-creator-selection (README).

ID	What it is	Where it comes from
cr_CR-13_bootstrap_top5 (same pattern for every creator and measure)	Per-creator figures: score rank, rank stability, food share, sponsored share, comment-for-link share, rank without those posts, child-on-camera share, rival and past Little Joys posts, followers, flags	outputs/creators/*.csv, data/creator_posts.csv
ads_H1, ads_H3, ads_H6, ads_H1_cvr_in	Ad-group comparisons: return per rupee, confidence interval, purchase rate	outputs/ads/findings.csv
ads_robust_H1, floor_mix_milk_mix_powder, posthoc_H1in_H6in	Robustness checks, floor-set mix, post-hoc table	outputs/ads/robustness.csv, structural.csv, posthoc_h1_h6.csv
rule_weights, rule_cap	Scoring rule fixed before scoring	config/weights.yaml
data_rows, limit_pricing, comparisons_ad_findings, five_total_followers	Row counts, dates, units, missing values, spend floor, limits, number of tests run	data/*.csv, outputs/audit/
label_ALL_LABELS, proxy_precision	Keshav's review of the AI labels (sheet pre-filled by an AI assistant) and his own check of child-and-product posts	outputs/audit/, outputs/final/manual_checks.csv
LJ-007 (and other ad IDs), product_protein_figures	Text of the Little Joys ad with that ID, field claims_made	data/ads.csv
P-CR-13 (and other creator IDs)	Profile and caption text for that creator (AI-written labels, not watched)	data/creators.csv, data/creator_posts.csv
EXT-ASCI	ASCI, Guidelines for Influencer Advertising in Digital Media, with the 17 Aug 2023 health addendum; read 2026-11-05	ascionline.in/wp-content/uploads/2023/08/GUIDELINES-FOR-INFLUENCER-ADVERTISING-IN-DIGITAL-MEDIA.pdf
EXT-DCA	Department of Consumer Affairs note on endorsements, which names the 2022 misleading-advertisements guidelines; named only, not summarised	consumeraffairs.gov.in, "Endorsement Know-Hows" (PDF)
